

HIV Positives Risk Profile

How was the risk profile done?

We wanted to give you information about the recent risk behaviors in different subpopulations in your area who have tested HIV positive through publicly-funded prevention counseling programs in Texas. But just like the epi information, it can be hard to absorb and deal with different strands of information about different groups. So we have calculated risk scores for each subpopulation. These risk scores are based on information collected in HIV Prevention Counseling sessions (see ***How did you get this information?*** below). We included 11 behaviors/risk indicators in the risk profile:

Barrier use with oral sex: The percent of clients who said they “almost never” used condoms with oral sex (out of those who reported oral sex in the last year)

Barrier use with vaginal sex: **The percent of clients who said they “almost never” used condoms with vaginal sex (out of those who reported this kind of sex in the last year)**

Barrier use with anal sex: The percent of clients who said they “almost never” used condoms with anal sex (out of those who reported anal sex in the last year)

STD history: The percent of clients who said they had an STD in the last year

Multiple partners: The percent of clients who said they had multiple sexual partners in the last year.

Sex partner at risk: The percent who said they had a sex partner at risk. The sex partner risks include all of the following: man who has sex with men, injecting drug use, partner with HIV/AIDS, or some other risk for HIV.

Sex partner with multiple partners – Percent of clients who said their sex partners have multiple sex partners.

Buying sex with money or drugs: The percent of clients who report buying sex with money or drugs in the last year

Selling sex for money or drugs: The percent who said they sold sex in the last year.

Drug use with sex: The percent of clients who said they used substance(s) before sex/during sex in the last year. The list of possible substances includes alcohol, pot, cocaine, and heroin.

Sharing needles: The percent of clients who said they shared syringes and/or injection equipment in the last year.

How did you get this information?

All risk profile information presented in this Epidemic Profile comes from risk behavior information reported by clients to counselors during Prevention Counseling (PC) sessions. These are recent risks for HIV – behaviors that have occurred in the 12 months before the counseling session. This information reflects PC sessions that took place January 1, 1999 through December 31, 2000 using the updated Texas HIV Prevention Counseling report form. Due to small numbers in some racial and ethnic categories, we have only presented risk information on Behaviorally-Dependent Target Populations (BDTPs: M/MS, IDU, and F/MS) and by sex.

Is this information accurate? Can it be used to say what risk behaviors are going on in the community?

This information comes from what PC counselors report about the sessions they do with clients. If a risk doesn't come up during a session, it is not reported, so if clients don't report all their risk behaviors they won't show up here. For this reason, all the percentages should be considered minimum estimates of that behavior in clients. Also remember that this is information from PC clients, not a random sample of MMS, IDU or FMS. If your own observations tell you that certain groups within risk population don't accessing PC very often, say African American M/MS, then you may want to suggest that more information be gathered on this group through needs assessment. When the numbers of clients in a group is very small, we indicated this in the summary of the profile. So the PC information is not perfect, but it gives a good idea of how "prevalent" a risk behavior is among PC clients– are lots members of a subpopulation reporting it, or only a few? Use it as a way of comparing between groups, and maybe to spark some questions for your needs assessment.

Risk Profile Tables

Risk profile tables are calculated for each HMAZ and LMAZ in an area. The table below is an example showing the risk profile for Hispanics in Area X.

	M/MS	IDU		F/MS	
Barrier Use		Male	Female	Male	Female
Oral^	*	*	100	91	81
Vaginal^	*	50	50	48	58
Anal^	*	*			25
STD History	43	0	22	16	6
Multiple Partners	43	80	67	31	13
Exchange Sex					
Bought	0	60	0	7	0
Sold	0	20	22	0	0
Substance Use	71	80	100	67	38
Sharing Needles		80	67		
Partner risk	43	60	33	5	6
Partner Mult Partners	29	40	56	24	21

^barrier use is presented as proportion never used barrier, all other measures report proportion reporting that behavior.

* Indicates one, two or three positives of that sub-population (sample size too small to report statistics)

The first column identifies the risk factor.

Columns identify behavioral classifications and sex.

All numbers represent proportion of the indicated sub-population who reported the risk behavior in the past year. For example, in the section of the table shown above, it indicates that 91% of prevention counseled F/MS men in this particular analysis zone indicated they never used a barrier for oral sex.

Notice that the M/MS and IDU male sections are shaded green. For analysis, we have decided that a minimum of five counseling sessions must be present to be confident about the proportion shown. The areas shaded indicate those risk factors in which there is insufficient evidence to comment upon. The number of sessions for these limited factors are indicated by the color of the shading. In the above example, the green shading in M/MS and IDU males indicates there were only 3 prevention counseling sessions for M/MS and IDU males in this analysis zone discussed barrier use with oral sex.

The information is presented as statewide summaries by Race/Ethnicity and by Age Group, then individually by HMAZ/LMAZ area (See 2000 HIV Epidemic Profile for description of HMAZ and LMAZ analysis zones)
